2. Problem and Intended Users

Residents and students in San Diego City Council District 1 may find it difficult to see what types of non-emergency issues have been reported near their community.

Our project aims to develop an interactive application/website that allows users to explore and visualize public service requests, such as potholes, streetlight failures, illegal dumping, and graffiti.

Users will be able to filter reports by neighborhood, ZIP code, issue type, and date, compare reporting patterns across communities, and examine how long different types of requests typically take to close.

The application is intended for District 1 residents, students, and people considering moving to a new neighborhood.

3. Data Sources and Size

We will use the City of San Diego's publicly available Get It Done Service Requests Dataset:

https://data.sandiego.gov/datasets/get-it-done-reports/

We will select records with council_district = 1 and date_requested in 2026. The full dataset contains millions of historical records. We plan to use a 10,000-record sample during early development, then determine the size of the final District 1, 2026 dataset after filtering.

Relevant fields include request type, submission date, status, geographic coordinates, neighborhood, and ZIP code. We will not need to display the free-text report description.

4. Definition of "Done"

The finished website should be able to:

- Display 2026 Get It Done reports from District 1 on an interactive map.
- Filters by issue type, date, neighborhood or ZIP code, and status.
- Let users search by neighborhood or ZIP code to find nearby reports.
- Show a reports' type, submission date, status, and location when a user clicks its map marker.
- Display interactive charts summarizing reports by month and issue type.

5. Questions or Concerns

Get It Done records are user-submitted reports and may include duplicate or unverified reports. A closed status does not necessarily mean that the reported issue was repaired. We will describe our results as reported requests, not as a complete measure of neighborhood conditions. To keep the project manageable, users will search by ZIP code or neighborhood rather than using automatic geolocation. We welcome feedback on whether this scope is appropriate.
